# PRODUCT INFORMATION

## 4-Hydroxybenzyl Alcohol

Item No. 31209

**CAS Registry No.:** 623-05-2

Formal Name: 4-hydroxy-benzenemethanol

Synonyms: NSC 227926, p-Hydroxybenzyl Alcohol

MF:  $C_7H_8O_2$ FW: 124.1 **Purity:** ≥98%

UV/Vis.:  $\lambda_{max}$ : 226 nm Supplied as: A crystalline solid

Storage: -20°C Stability: ≥4 years Item Origin: Synthetic

Information represents the product specifications. Batch specific analytical results are provided on each certificate of analysis.

## **Laboratory Procedures**

4-Hydroxybenzyl alcohol is supplied as a crystalline solid. A stock solution may be made by dissolving the 4-hydroxybenzyl alcohol in the solvent of choice, which should be purged with an inert gas. 4-Hydroxybenzyl alcohol is soluble in organic solvents such as ethanol, DMSO, and dimethyl formamide (DMF). The solubility of 4-hydroxybenzyl alcohol in these solvents is approximately 15 mg/ml in ethanol and 30 mg/ml in DMSO and DMF.

4-Hydroxybenzyl alcohol is sparingly soluble in aqueous buffers. For maximum solubility in aqueous buffers, 4-hydroxybenzyl alcohol should first be dissolved in DMSO and then diluted with the aqueous buffer of choice, 4-hydroxybenzyl alcohol has a solubility of approximately 0.09 mg/ml in a 1:10 solution of DMSO:PBS (pH 7.2) using this method. We do not recommend storing the aqueous solution for more than one day.

#### Description

4-Hydroxybenzyl alcohol is a phenol and an aglycone form of gastrodin (Item No. 28828) that has been found in Gastrodia and has diverse biological activities. 1-4 It inhibits LPS-induced production of nitric oxide (NO) and reactive oxygen species (ROS) and decreases inducible nitric oxide synthase (iNOS), but not COX-2, levels in RAW 264.7 cells when used at concentrations of 0.5 and 1 mM.2 4-Hydroxybenzyl alcohol (1.5 and 4.5 mg/animal) reduces exudate volume and leukocyte infiltration in a rat model of carrageenan-induced air pouch inflammation, and inhibits acetic acid-induced writhing in mice when administered at doses of 50 and 100 mg/kg. It reduces infarct volume and the number of TUNEL-positive neurons in the ipsilateral cortex in a rat model of focal cerebral ischemia induced by transient middle cerebral artery occlusion (MCAO) when administered at a dose of 50 mg/kg.4 4-Hydroxybenzyl alcohol (50 and 100 mg/kg) increases the number of entries into, and the percentage of time spent in, the open arms of the elevated plus maze in mice, indicating anxiolytic-like activity.3
