PRODUCT INFORMATION

4-hydroxy Nonenal Mercapturic Acid-d₂

Item No. 9000348

Formal Name:	N-acetyl-S-(tetrahydro-5-hydroxy-2- pentyl-3-furanyl)-L-cysteine-11,11,11-d ₃	OH S
MF:	$C_{14}H_{22}D_3NO_5S$	
FW:	322.4	
Chemical Purity:	≥98% (4-hydroxy nonenal mercapturic acid)	
Deuterium		D
Incorporation:	≥99% deuterated forms (d₁-d₃); ≤1% d₀	
Supplied as:	A solution in ethanol	H' \
Storage:	-80°C	ö
Stability:	≥2 years	
Information represents the product specifications. Batch specific analytical results are provided on each certificate of		

analysis.

Laboratory Procedures

4-hydroxy Nonenal mercapturic acid-d₂ is intended for use as an internal standard for the quantification of 4-hydroxy nonenal mercapturic acid by GC- or LC-MS. The accuracy of the sample weight in this vial is between 5% over and 2% under the amount shown on the vial. If better precision is required, the deuterated standard should be quantitated against a more precisely weighed unlabeled standard by constructing a standard curve of peak intensity ratios (deuterated versus unlabeled).

4-hydroxy Nonenal mercapturic acid- d_3 is supplied as a solution in ethanol. To change the solvent, simply evaporate the ethanol under a gentle stream of nitrogen and immediately add the solvent of choice. Solvents such as DMSO and dimethyl formamide purged with an inert gas can be used. The solubility of 4-hydroxy nonenal mercapturic acid-d₃ in these solvents is approximately 50 mg/ml.

Description

Peroxidation of polyunsaturated fatty acids in circulating lipid particles and membrane phospholipids leads to transient fatty acid hydroperoxides.¹ Several non-enzymatic routes of decomposition are available to these lipid hydroperoxides, including a β -cleavage reaction which breaks the carbon-carbon bond next to the hydroperoxide and produces alkenals, including 4-hydroxy nonenal (4-HNE). Common ω -6 fatty acids such as linoleic acid, dihomo-γ-linolenic acid, and arachidonic acid can give rise to 4-HNE. 4-HNE is cleared rapidly from the plasma and undergoes enterohepatic circulation as a glutathione conjugate in the rat.² About two thirds of an administered dose of 4-HNE is excreted within 48 hours in the urine, primarily in the form of mercapturic acid conjugates.³ The C-1 aldehyde of 4-HNE is reduced to an alcohol in about half of these metabolites. The remainder are C-1 aldehydes or have been oxidized to C-1 carboxylic acids. These aldehydes and carboxylic acids can also form γ -lactols and γ -lactones, respectively, producing at least four or five end urinary metabolites of 4-HNE in vivo.
