GENERAL INFORMATION

Materials Supplied

Kit will arrive packaged as a -20°C kit. After opening kit, store the individual components as stated below.

If any of the items listed above are damaged or missing, please contact our Customer Service department at (800) 364-9897 or (734) 971-3335. We cannot accept any returns without prior authorization.

WARNING: THIS PRODUCT IS FOR RESEARCH ONLY - NOT FOR HUMAN OR VETERINARY DIAGNOSTIC OR THERAPEUTIC USE.

Safety Data

This material should be considered hazardous until further information becomes available. Do not ingest, inhale, get in eyes, on skin, or on clothing. Wash thoroughly after handling. Before use, the user must review the complete Safety Data Sheet, which has been sent via email to your institution.
Precautions

Please read these instructions carefully before beginning this assay.

If You Have Problems

Technical Service Contact Information

Phone: 888-526-5351 (USA and Canada only) or 734-975-3888
Fax: 734-971-3641
Email: techserv@caymanchem.com
Hours: M-F 8:00 AM to 5:30 PM EST

In order for our staff to assist you quickly and efficiently, please be ready to supply the lot number of the kit (found on the outside of the box).

Storage and Stability

This kit will perform as specified if stored as directed in the Materials Supplied section, on page 3, and used before the expiration date indicated on the outside of the box.

Materials Needed But Not Supplied

1. Adjustable pipettes
2. A 6-, 12-, 24-, or 96-well plate for culturing cells
3. A fluorescence microscope or plate reader equipped with laser/fluorescent filters capable of detecting the J-aggregate form of JC-1 using an excitation of 535 nm and an emission at 590 nm as well as the monomeric form of JC-1 at excitation and emission wavelengths of 485 and 535 nm, respectively
4. Distilled water

INTRODUCTION

Background

$\Delta \psi_M$ is an important parameter of mitochondrial function and has been used as an indicator of cell health. Variations of $\Delta \psi_M$ have been previously studied using cationic dyes such as rhodamine-123 (Rh123) and DiOC$_6$. More recently, a cytofluorimetric, lipophilic cationic dye, 5,5',6,6'-tetrachloro-1,1';3,3'-tetraethylbenzimidazolylcarbocyanine iodide (JC-1), has been developed. JC-1 has advantages over other cationic dyes in that it enters the mitochondria and changes its fluorescent properties based on the aggregation of the probe. In healthy cells with high $\Delta \psi_M$, JC-1 forms complexes known as J-aggregates with intense red fluorescence. However, in cells with low $\Delta \psi_M$, JC-1 remains in the monomeric form, which exhibits green fluorescence. The higher the ratio of red to green fluorescence, the higher the polarization of the mitochondrial membrane.

About This Assay

Cayman’s JC-1 Mitochondrial Membrane Potential Assay Kit can be used to study mitochondrial behavior in a variety of conditions, including apoptosis. Changes in $\Delta \psi_M$ reflected by different forms of JC-1 as either green or red fluorescence can be determined as a ratio of green:red using fluorescence microscopy or a fluorescence plate reader with appropriate filter sets.
PRE-ASSAY PREPARATION

NOTE: JC-1 is light sensitive. Do not expose to direct intense light.

Thaw the JC-1 Reagent at room temperature. Mix well. To avoid repeated freeze/thawing of this solution, we recommend that you make small aliquots and store them at -20°C.

Reagent Preparation

1. Assay Buffer Preparation
   Dissolve three Cell-Based Assay Buffer tablets (Item No. 10009322) in 300 ml of distilled water. This buffer should be stable for approximately one year at room temperature.

2. JC-1 Staining Solution Preparation
   Thaw an aliquot of the JC-1 Reagent (Item No. 10009908) at room temperature. Prepare a staining solution by diluting the reagent 1:10 in the culture medium you are using for your cells. Mix well to make sure there are no particles or flakes in the solution.

   NOTE: JC-1 Staining Solution is difficult to prepare due to its low solubility in aqueous medium and tendency to form particulates that are difficult to remove. Make sure JC-1 Reagent is completely thawed and warmed to room temperature before diluting it into culture medium. Do not centrifuge the reagent.

NOTES

• JC-1 is light sensitive. All staining procedures must be performed without direct exposure to intense light. Therefore, incubations need to be done in the dark.
• For all assay protocols, on pages 7-10, it is imperative that samples be analyzed immediately following completion of the staining.

ASSAY PROTOCOL

Fluorescence Microscopy

A 6-, 12-, 24-, or 96-well culture plate can be used for this method. Optimal conditions will be dependent on the cell type, it is recommended that cells be no more than 80% confluent by the time of visualization.

1. Culture and treat cells according to your normal protocol in duplicate or triplicate.

2. Add 100 μl of the JC-1 Staining Solution (prepared on page 6) per ml of culture medium to each well of the plate. Mix gently. NOTE: If staining is too intense, titrating down the final JC-1 concentration may be required.

3. Incubate samples in a CO₂ incubator at 37°C for 15-30 minutes. Sufficient staining is usually obtained after 15 minutes of incubation. The cells can be analyzed directly in the culture medium since phenol red does not interfere with fluorescent staining. Healthy cells with mainly JC-1 J-aggregates can be detected with filter sets usually designed to detect rhodamine (excitation/emission = 540/570 nm). Apoptotic or unhealthy cells with mainly JC-1 monomers can be detected with filter sets designed to detect FITC (excitation/emission = 485/535 nm).
ASSAY PROTOCOL

ASSAY PROTOCOL

Plate Reader

A 96-well Black culture plate should be used for this method. We recommend that cells be no more than 80% confluent at time of staining. Optimal conditions will be dependent on the cell type.

1. Culture cells in a 96-well black plate at a density of $5 \times 10^4 - 5 \times 10^5$ cells/well in 100 μl culture medium in a CO₂ incubator overnight at 37°C. Treat the cells with or without experimental compounds (each sample should be run in duplicate or triplicate). Incubate the cells according to your normal protocol.

2. Add 10 μl of the JC-1 Staining Solution (prepared above) to each well and mix gently. Further dilution, such as adding 5 μl of JC-1 Staining Solution to 100 μl of culture medium, may be used in cases where the staining is too intense.

3. Incubate the cells in a CO₂ incubator at 37°C for 15-30 minutes. Sufficient staining is usually obtained after 15 minutes of incubation.

4. Centrifuge the plate for five minutes at 400 x g at room temperature. Carefully aspirate the supernatant.

5. Add 200 μl of Assay Buffer to each well and centrifuge the plate for five minutes at 400 x g at room temperature. Carefully aspirate the supernatant.

6. Repeat step 5 one more time.

7. Add 1 ml, 500 μl, 250 μl, or 100 μl of Assay Buffer to each well of 6-, 12-, 24-, or 96-well plate, respectively. The cells are now ready for analysis by fluorescent microscopy and must be analyzed immediately, as described in step 3.

The following steps are optional:

4. Centrifuge the plate for five minutes at 400 x g at room temperature. Discard the supernatant by careful aspiration.

5. Add 2 ml, 1 ml, 500 μl, or 200 μl of Assay Buffer to each well of 6-, 12-, 24-, or 96-well plate respectively.

6. Centrifuge the plate for five minutes at 400 x g at room temperature. Carefully aspirate the supernatant.

7. Repeat steps 5-6.

8. Add 1 ml, 500 μl, 250 μl, or 100 μl of Assay Buffer to each well of 6-, 12-, 24-, or 96-well plate, respectively. The cells are now ready for analysis by fluorescent microscopy and must be analyzed immediately, as described in step 3.
Figure 1. JC-1 staining pattern indicates loss of membrane potential in H9C2 cells treated with FCCP. H9C2 cells were plated at a density of $2 \times 10^4$ and cultured overnight. The next day, cells were stained with JC-1 according to the protocol on page 7 and imaged with BioTek’s Cytation™ 5 Cell Imaging Multi-Mode Reader before (Panel A) and after (Panel B) treatment with 10 µM FCCP. The 20X objective and three LED filter cubes were used: Violet (blue nuclear stain, Hoechst, Item No. 600332), FITC (diffuse green J-monomers) and Texas Red (punctate red mitochondrial J-aggregates).

Figure 2. Ratio of J-aggregates to J-monomers in a 96-well plate format. H9C2 cells were plated at a density of $2 \times 10^5$ cells/well and cultured overnight. Cells were stained with JC-1 according to the protocol on page 9. Post staining, cells were treated with FCCP in and incubated in the dark for 10 minutes. Florescence of J-aggregates and J-monomers was measured using excitation/emission wavelengths of 535/595 nm and 485/535 nm, respectively. Data are shown as a ratio of J-aggregates to J-monomers.
## Troubleshooting

<table>
<thead>
<tr>
<th>Problem</th>
<th>Possible Causes</th>
<th>Recommended Solutions</th>
</tr>
</thead>
<tbody>
<tr>
<td>No staining</td>
<td>Samples have been fixed with a fixative such as paraformaldehyde</td>
<td>Assays should be performed without any fixation</td>
</tr>
</tbody>
</table>
| Poor staining                                | A. JC-1 staining solution has been centrifuged  
B. Stained cells have been exposed to strong light | A. Do not centrifuge JC-1 staining solution as this will precipitate the reagent  
B. Analyze the stained cells immediately after washing |
| Control cells without treatment show low ratio of red to green signal | Control cells are not healthy                                                   | Use only healthy cells                                                                  |
| Staining is too strong                       | JC-1 staining solution is too concentrated for this cell type                  | Dilute JC-1 staining solution (see Assay Protocols for more details)                    |
