PRODUCT INFORMATION

Apixaban
Item No. 15427

CAS Registry No.: 503612-47-3
Formal Name: 4,5,6,7-tetrahydro-1-(4-methoxyphenyl)-7-oxo-6-[4-(2-oxo-1-piperidinyl)phenyl]-1H-pyrazolo[3,4-c]pyridine-3-carboxamide
Synonym: BMS 562247-01
MF: C25H25N5O4
FW: 459.5
Purity: ≥98%
UV/Vis.: λmax: 281 nm
Supplied as: A crystalline solid
Storage: -20°C
Stability: ≥2 years

Information represents the product specifications. Batch specific analytical results are provided on each certificate of analysis.

Laboratory Procedures

Apixaban is supplied as a crystalline solid. A stock solution may be made by dissolving the apixaban in the solvent of choice. Apixaban is soluble in organic solvents such as DMSO and dimethyl formamide, which should be purged with an inert gas. The solubility of apixaban in these solvents is approximately 5 and 3 mg/ml, respectively.

Apixaban is sparingly soluble in aqueous buffers. For maximum solubility in aqueous buffers, apixaban should first be dissolved in DMSO and then diluted with the aqueous buffer of choice. Apixaban has a solubility of approximately 0.5 mg/ml in a 1:1 solution of DMSO:PBS (pH 7.2) using this method. We do not recommend storing the aqueous solution for more than one day.

Description

Apixaban is an orally bioavailable, selective inhibitor of both free and prothrombinase-bound factor Xa (Ks = 0.8 nM).1 In vivo, apixaban has antithrombotic effects in a rabbit model of venous thrombosis. Apixaban (357.5 mg) also prevents thrombus formation without inducing adverse bleeding events in a porcine model of aortic heterotopic valve replacement.2 Formulations containing apixaban have been used to prevent blood clot formation in patients with atrial fibrillation.
