If any of the items listed above are damaged or missing, please contact our Customer Service department at (800) 364-9897 or (734) 971-3335. We cannot accept any returns without prior authorization.

WARNING: THIS PRODUCT IS FOR RESEARCH ONLY - NOT FOR HUMAN OR VETERINARY DIAGNOSTIC OR THERAPEUTIC USE.

Safety Data

This material should be considered hazardous until further information becomes available. Do not ingest, inhale, get in eyes, on skin, or on clothing. Wash thoroughly after handling. Before use, the user must review the complete Safety Data Sheet, which has been sent via email to your institution.
Precautions

Please read these instructions carefully before beginning this assay.

If You Have Problems

Technical Service Contact Information

Phone: 888-526-5351 (USA and Canada only) or 734-975-3888
Fax: 734-971-3641
Email: techserv@caymanchem.com
Hours: M-F 8:00 AM to 5:30 PM EST

In order for our staff to assist you quickly and efficiently, please be ready to supply the lot number of the kit (found on the outside of the box).

Storage and Stability

This kit will perform as specified if stored at -20°C and used before the expiration date indicated on the outside of the box.

Materials Needed But Not Supplied

1. A plate reader with the ability to measure fluorescence or fluorescence polarization using fluorescein as the fluorophore
2. Adjustable pipettes and a multichannel or repeating pipette
3. A source of pure water; glass distilled water or HPLC-grade water is acceptable

About This Assay

Cayman’s Protease Activity Assay Kit provides a convenient method for determining the activity of proteases in samples. Proteolytic digestion of the FITC-casein substrate can be monitored by changes in either fluorescence polarization (FP) or total fluorescence.¹ Fluorescence is the ability of a molecule to absorb the energy of an incoming (excitation) photon and then re-emit this energy as a new, slightly less energetic (emission) photon. A small fluorescent molecule will rotate appreciably during the very small interval of time between absorption of a photon and emission of the fluorescence photon. If the excitation light is polarized, this rotation will result in randomization of the plane of the emitted light. Thus, small fluorescent molecules depolarize an excitation pulse of polarized light. Large fluorescent molecules, like FITC-casein, do not rotate as appreciably in the same small interval of time. They will, therefore, emit light that retains some of the polarization of the polarized excitation light. This polarization is quantified as millipolarization units, or mP. In this assay, the total FP decreases as the FITC-casein is digested into smaller, quicker rotating fluorescein-labeled fragments.

If measuring FP is not available, the change in total fluorescence can also be measured to determine protease activity. The conjugation of FITC to casein results in moderate quenching of the total fluorescence. This fluorescence increases as the FITC-casein substrate is digested into smaller fluorescein-labeled fragments. Both assay formats use an excitation wavelength of 480-495 nm and an emission wavelength of 515-525 nm.
Pre-Assay Preparation

Reagent Preparation

1. **Protease Assay Buffer** - (Item No. 701411)
   This vial contains 20 ml of 25 mM Tris, pH 7.2, containing 150 mM sodium chloride. Once thawed, this buffer is ready to use, and remaining buffer can be stored at -20°C for up to six months.

2. **Protease Substrate** - (Item No. 701412)
   Each vial contains lyophilized FITC-casein. Reconstitute the contents of the vial with 6 ml of Protease Assay Buffer. One vial of FITC-casein substrate should be sufficient substrate to assay 60 wells. Use the additional vial if assaying the entire plate. **NOTE: Avoid exposing the FITC-casein to intense light.** Remaining Protease Substrate can be stored at -20°C for up to six months.

3. **Protease Positive Control** - (Item No. 701413)
   Each vial contains lyophilized trypsin. Reconstitute the contents of a vial with 500 μl of Protease Assay Buffer, store on ice and use within two hours. Each vial should be sufficient to run four positive control wells.

---

Figure 1. Changes in fluorescence are observed after digestion of FITC-casein by proteases
Pipetting Hints

- It is recommended that a multichannel pipette be used to deliver reagents to the wells. This saves time and helps to maintain more precise incubation times.
- Before pipetting each reagent, equilibrate the pipette tip in that reagent (i.e., slowly fill the tip and gently expel the contents, repeat several times).
- Do not expose the pipette tip to the reagent(s) already in the well.

General Information

- The final volume of the assay is 200 µl in all the wells.
- All reagents, except the Protease Positive Control (Item No. 701413), must be equilibrated to room temperature before beginning the assay.
- It is not necessary to use all the wells on the plate at one time.
- It is recommended to assay the samples in triplicate, but it is the user’s discretion to do so.
- The assay is performed at room temperature.
- Monitor the fluorescence or FP with an excitation wavelength of 480-495 nm and an emission wavelength of 515-525 nm.

Plate Set Up

There is no specific pattern for using the wells on the plate. However, it is recommended to have three wells designated as Protease Positive Control and three wells designated as Background. It is suggested that the contents of each well are recorded on the template sheet provided on page 14. A typical layout of samples to be measured in triplicate is shown in Figure 2.

Figure 2. Sample plate format
Performing the Assay

1. Positive Control Wells - add 100 µl of Protease Positive Control (Item No. 701413) to three wells.
2. Sample Wells - add 100 µl of sample to at least three wells.
3. Background Wells - add 100 µl of Protease Assay Buffer to three wells.

Table 1. Pipetting summary

4. Initiate the reactions by adding 100 µl of Protease Substrate to all the wells being used.
5. Cover the plate with the foil plate cover and incubate for twenty minutes at room temperature on an orbital shaker.
6. Remove the plate cover, and measure the fluorescence or FP with an excitation wavelength of 480–495 nm and an emission wavelength of 515–525 nm.

Calculations

1. FP of a molecule is defined as:

\[
Polarization (\text{mP}) = 1,000 \times \frac{(I_{||} - I_{\perp} \times G)}{(I_{||} + I_{\perp} \times G)}
\]

where:
- \(I_{||}\) = Fluorescence intensity parallel to the excitation plane
- \(I_{\perp}\) = Fluorescence intensity perpendicular to the excitation plane
- \(G\) = Instrument-specific correction factor

2. Determine the average fluorescence or FP of each sample.
3. Subtract the average fluorescence of the background sample from itself and all other values. This is the corrected fluorescence.
4. Plot the corrected fluorescence or non-corrected mP versus protease concentration. An example is shown in Figure 3, see page 12.
Performance Characteristics

Sample Data:
The data shown here is an example of FP or total fluorescence data typically produced with this kit; however, your results will not be identical to these. Do not use the data below to directly compare to your samples. Your results could differ substantially.
